INTRODUCTION

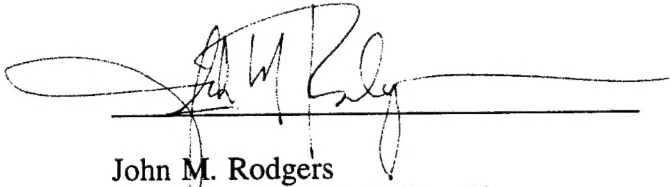

The *Census of U.S. Civil Aircraft* is published annually by the Federal Aviation Administration. Its purpose is to serve as a reference on the U.S. civil aircraft fleet.

Chapter I shows summary information about the registered civil fleet—both active and inactive aircraft. These statistics were compiled from official records maintained by the Aircraft Registry, Mike Monroney Aeronautical Center. The detailed counts by manufacturer and model shown in Appendix A were also developed from these registration records.

Prior to 1992 the U.S. air carrier fleet data shown in Chapter 2 were developed from monthly Aircraft/Engine Utilization Reports submitted by air carrier operators. Beginning with 1992 the data were developed from the Vital Information System. The aircraft population shown in this chapter is not an inventory of the aircraft owned by the air carriers but represents the aircraft actually used by the air carriers.

The information about general aviation aircraft shown in Chapter 3 and Appendix C were developed from two different sources. The registered aircraft information was compiled from the Registry records at the Aeronautical Center. The state and county of the aircraft shown in Appendix C is assigned based on the registrant's address as shown on the registration records. Statistics on the number of active general aviation aircraft and flight hours were compiled using a sample survey of owners.

The *Census of U.S. Civil Aircraft* is prepared by the Statistics and Forecast Branch, Planning Analysis Division, Office of Aviation Policy, Plans and Management Analysis. Suggestions and comments on the scope and content of this report are requested and will be given careful consideration in planning future editions.

Note: Air carrier aircraft are aircraft carrying passengers or cargo for hire under 14 CFR 121 (large aircraft—more than 30 seats) and 14 CFR 135 (small Aircraft—30 seats or less). This definition is more encompassing than that used in the FAA Aviation Forecast—jet aircraft, 60 seats or more carrying passengers or cargo for hire.

Note: Beginning in 1987, the number of aircraft is the monthly average of the number of aircraft reported in use for the last three months of the year. Prior to 1987, it was the number of aircraft reported in use during December of the year.

AVERAGE ACTIVE PILOTS PER REGISTERED GENERAL AVIATION AIRCRAFT BY STATE

(U.S. AVERAGE=2.4)
December 31, 1993

ACTIVE GENERAL AVIATION AIRCRAFT AND HOURS FLOWN

The tables in the rest of this chapter show activity for general aviation aircraft. These data are for the active—flew one or more hours during the year—fleet as opposed to the registered fleet data shown in preceding tables.

General aviation aircraft activity information was obtained using the *General Aviation Activity and Avionics Survey*, which is mailed to the owners of a sample of registered general aviation aircraft. The survey collects data relative to flight hours, airframe hours and the avionics equipment on board the aircraft. In addition, the survey collects information about the number of hours flown under instrument flight rules, fuel consumption rates, and the state where the aircraft is based.

The sample is a scientifically designed random sample which represents all general aviation aircraft registered in the United States.

Because the estimates are derived from a sample—not the total population of aircraft—a certain amount of sampling error is introduced. The user must consider this error along with the estimate itself when making an inference or drawing any conclusions about the aircraft population. Although the exact value of the sample error is unknown, a quantity known as the standard error is used to approximate it. Using the standard error one can develop an interval within which the true population estimate will lie with a known probability. The probability that the true value lies within the interval depends on the width of the interval, i.e., the estimate plus or minus 1, 2, or 3 times the standard error. The table below shows selected interval widths and their corresponding confidence.

Width of Interval	Approximate Confidence That Interval Includes True Value
1 standard error	68%
2 standard errors	95%
3 standard errors	99%

For example, if the estimate for the total number of active piston powered rotorcraft were 2,658 and the standard error was 176, then the 95% confidence interval would be $2,658 + 2(176)$ or (2,306; 3,010). One would say that there is a 95% chance that the number of active piston powered rotorcraft lies between 2,306 and 3,010.

In some tables the standard error is expressed as a percent. To calculate the standard error multiply the estimate by the percentage. To derive the 95% confidence interval proceed as before. For example, if total hours flown were 35,792 thousand hours and the percentage standard error was 3.0%, the 95% confidence interval would be:

$$\begin{aligned} 35,792 + (2 \times 3.0\% \times 35,792) &= \\ 35,792 + 2,148 &= \\ (33,644; 37,940) \end{aligned}$$

The standard error or the percent standard error, is shown for each estimate made for the sample in this chapter.

More detail estimates and a more detailed discussion of the survey and its methodology are available in *General Aviation Activity and Avionics Survey Report*.
